

ActivityContextInterface Extension

Table of Contents

This simple extension to JAIN SLEE 1.1 introduces *org.mobicents.slee.ActivityContextInterfaceExt* interface, which extends *javax.slee.ActivityContextInterface* with methods to retrieve the timers and names bound to the ACI.

```
package org.mobicents.slee;

import javax.slee.ActivityContextInterface;
import javax.slee.facilities.TimerID;

public interface ActivityContextInterfaceExt extends ActivityContextInterface {

    public TimerID[] getTimers();

    public String[] getNamesBound();

}
```

*The **getTimers()** method*

Retrieves the IDs of timers currently set which are related to the ACI.

*The **getNamesBound()** method*

Retrieves the names currently bound to the ACI.

*The **suspend()** method*

This feature may be used before attaching to an *ActivityContextInterface*, to ensure that any event fired concurrently will be received. It suspends routing of events in the activity context immediately, till the active transaction ends.
