Application security varies depending on the server type used. The following procedures describe how to configure the JBoss AS7 and Tomcat servers to enable Security.

Procedure: Enable SIP Application Security in JBoss AS7

- 1. Add Security Policy to Server Configuration
 - a. Open the configuration file located in \$JBOSS_HOME/standalone/configuration/standalonesip.xml
 - b. Append a security domain to the under the <security-domains>:

```
<security-domain name="sip-servlets">
   <authentication>
       <le>"required">
           <module-option name="usersProperties"
value="${jboss.server.config.dir}/sip-servlets-users.properties"/>
           <module-option name="rolesProperties"
value="${jboss.server.config.dir}/sip-servlets-roles.properties"/>
           <module-option name="hashAlgorithm" value="MD5"/>
           <module-option name="hashEncoding" value="RFC2617"/>
           <module-option name="hashUserPassword" value="false"/>
           <module-option name="hashStorePassword" value="true"/>
           <module-option name="passwordIsA1Hash" value="true"/>
           <module-option name="storeDigestCallback"
value="org.jboss.security.auth.callback.RFC2617Digest"/>
       </login-module>
   </authentication>
</security-domain>
```

- 2. Create SIP Server User Properties File
 - a. Open a terminal and navigate to the \$JBOSS_HOME/standalone/configuration directory:

```
home]$ cd standalone/configuration
```

b. Create and open a sip-servlets-users.properties file and append the user lines to the file:

```
# A sample users.properties file, this line creates user "admin" with # password "admin" for "sip-servlets-realm" admin=<A1_cryptographic_string>
```

c. To create <A1_cryptographic_string>, execute the following command in a terminal:

```
home]$ java -cp ../../modules/system/layers/base/org/picketbox/main/picketbox-4.0.15.Final.jar org.jboss.security.auth.callback.RFC2617Digest admin sip-servlets <password>
```

- d. Copy the A1 hash, and paste it into the admin parameter in the previous step.
- e. Save and close sip-servlets-users.properties.
- 3. Create the SIP Server Roles File
 - a. Create and open sip-servlets-roles.properties (using your preferred editor) and append the following information to the file:

```
# A sample roles.properties file for use with some roles
# Each line in this file assigns roles to the users defined in
# sip-servlets-users.properties
admin=caller,role1,role2,..
```

- 4. Add the Security Domain to the SIP Application
 - a. Open the jboss-web.xml file for the SIP application to which security is required.
 - b. Add the element as a child of the element:

```
<jboss-web>
     <security-domain>sip-servlets</security-domain>
</jboss-web>
```

- 5. Add Security Constraints to the SIP Application
 - a. Open the sip.xml file for the SIP application.
 - b. Add the element as a child of the element:

```
<security-constraint>
    <display-name>REGISTER Method Security Constraint</display-name>
    <resource-collection>
        <resource-name>SimpleSipServlet</resource-name>
        <description>Require authenticated REGSITER requests/description>
        <servlet-name>SimpleSipServlet</servlet-name>
        <sip-method>REGISTER</sip-method>
    </resource-collection>
    <auth-constraint>
        <role-name>caller</role-name>
    </auth-constraint>
</security-constraint>
<login-config>
    <auth-method>DIGEST</auth-method>
    <realm-name>sip-servlets</realm-name>
</login-config>
```

Procedure: Enable SIP Application Security in Tomcat Server

- 1. Activate the Memory Realm in Catalina:
 - a. Open a terminal and navigate to the /conf directory:

```
home]$ cd server/default/<tomcat_home>/conf/
```

b. Open server.xml and uncomment the following line:

```
<!--<Realm className="org.apache.catalina.realm.MemoryRealm"/>-->
```

- 2. Update SIP Server User Properties File
 - a. In the /conf directory, open tomcat-users.xml (using your preferred editor) and append the following child element:

```
<user name="user" password="password" roles="caller"/>
```

- 3. Add Security Constraints to the SIP Application
 - a. Open the sip.xml file for the SIP application to which security is required.
 - b. Add the child element to the element:

```
<security-constraint>
 <display-name>REGISTER Method Security Constraint</display-name>
 <resource-collection>
    <resource-name>SimpleSipServlet</resource-name>
    <description>Require authenticated REGISTER requests/description>
    <servlet-name>SimpleSipServlet</servlet-name>
    <sip-method>REGISTER</sip-method>
 </resource-collection>
 <auth-constraint>
    <role-name>caller</role-name>
 </auth-constraint>
</security-constraint>
<login-config>
 <auth-method>DIGEST</auth-method>
 <realm-name>sip-servlets-realm</realm-name>
</login-config>
```
