This simple extension to JAIN SLEE 1.1 introduces *org.mobicents.slee.ActivityContextInterfaceExt* interface, which extends *javax.slee.ActivityContextInterface* with methods to retrieve the timers and names bound to the ACI.

```
package org.mobicents.slee;
import javax.slee.ActivityContextInterface;
import javax.slee.facilities.TimerID;
public interface ActivityContextInterfaceExt extends ActivityContextInterface {
    public TimerID[] getTimers();
    public String[] getNamesBound();
}
```

The getTimers() method

Retrieves the IDs of timers currently set which are related to the ACI.

The getNamesBound() method

Retrieves the names currently bound to the ACI.

The suspend() method

This feature may be used before attaching to an ActivityContextInterface, to ensure that any event fired concurrently will be received. It suspends routing of events in the activity context immediately, till the active transaction ends.
